

Nifty100 Analytics Platform

Analyst Guide

A practical guide for exploring the Nifty100 analytics dashboard, screening companies, comparing peers, reviewing financial trends, understanding capital allocation, and accessing generated reports.

Project Scope

- Coverage: 92 Nifty100 companies represented in the project dataset.
- Dashboard contains 8 screens: Home, Profile, Screener, Peers, Trends, Sectors, Capital, and Reports.
- Analytics include financial ratios, screening presets, peer comparison, valuation signals, cash-flow intelligence, pros/cons, clustering, and generated reports.
- API layer provides programmatic access to company, financial, screening, peer, valuation, sector, portfolio, and document information.

How to Use This Guide

Start with Home for navigation and high-level context. Use Profile for an individual company, Screener for filtering, Peers for comparison, Trends and Sectors for broader analysis, Capital for cash-flow and allocation intelligence, and Reports for generated documents.

1. Platform Overview

Typical Analyst Workflow

- 1) Select a company or screening objective.
- 2) Review core financial and operating metrics.
- 3) Compare the company with peers and sector context.
- 4) Review trends and capital-allocation signals.
- 5) Review valuation and qualitative intelligence.
- 6) Open the relevant tear sheet or sector report.

Key Analytical Outputs

Output	Purpose
Financial ratios	Profitability, leverage, valuation and efficiency measures.
Screener	Rule/preset-based company filtering.
Peer comparison	Compare companies within peer groups.
Valuation summary	Valuation metrics and valuation flags.
Cash-flow intelligence	CFO quality, CapEx and capital-allocation interpretation.
Pros/cons	Generated company-level qualitative insights.
Cluster labels	Five data-driven company archetypes.
Tear sheets / sector reports	Shareable company and sector summaries.

2. Home Screen

- Use Home as the entry point to the dashboard.
- Review the available analysis areas and navigation.
- Confirm the dashboard is connected to the project database.
- Use the navigation controls to move between analytical screens.

3. Profile Screen

- Use Profile for a company-level view of an individual Nifty100 company.
- Review company identity, financial indicators, valuation information and qualitative insights.
- Use the profile as the starting point for a deeper company review.
- If a field is blank, distinguish unavailable data from a true zero value.

4. Screener Screen

- Use Screener to narrow the 92-company universe using financial metrics and predefined logic.
- Project presets include Quality Compounder, Value Pick, Growth Accelerator, Dividend Champion, Debt-Free Blue Chip, and Turnaround Watch.
- Review the selected metrics together with the resulting companies.
- Use the export functionality when a filtered company list is required.

5. Peers Screen

- Use Peers to compare a company with its peer group.
- Review profitability, growth, leverage and other available metrics.
- Sector and peer context can help explain differences between companies.
- Use peer results together with Screener and Trends.

6. Trends Screen

- Use Trends to examine historical movement in financial and operating metrics.
- Look for direction, consistency, inflection points and unusual changes.
- Historical data should be interpreted across multiple periods where available.
- Cross-check unusual values against the underlying data.

7. Sectors Screen

- Use Sectors to understand company and metric patterns at sector level.
- Compare sector medians and individual company values.
- Sector context is useful for valuation and peer interpretation.
- Use sector reports for documented sector-level analysis.

8. Capital Screen

- Use Capital for cash-flow quality, CapEx and capital-allocation intelligence.
- Project classifications include Shareholder Returns, Reinvestor, Mixed, Growth Funded by Debt, and Liquidating Assets.
- A separate distress condition is used for negative CFO combined with positive CFF.
- Treat classifications as analytical signals derived from project rules and data.

9. Reports Screen

- Use Reports to access generated company tear sheets and sector reports.
- Tear sheets provide compact company summaries.
- Sector reports provide broader analytical summaries.
- Check that the expected report file exists before distribution.

10. Valuation & Intelligence Outputs

Valuation Summary

- The valuation output contains 92 company rows.
- Core fields include P/E, P/B, EV/EBITDA, FCF yield, five-year median P/E and comparison with sector median P/E.
- Project valuation flags include Fair, Discount and Caution.
- Review the underlying metrics before interpreting a valuation flag.

Qualitative Intelligence

- Pros/cons generation covers all 92 companies with at least one positive and one negative insight.
- Cash-flow intelligence combines CFO, CapEx and financing information into analyst-friendly classifications.
- Cluster analysis groups the 92 companies into five project-defined archetypes using standardized financial features.

11. API, QA & Troubleshooting

API

- The FastAPI layer exposes company, financial statement, ratio, tear-sheet, screener, sector, peer, valuation, market-cap, portfolio-statistics and document endpoints.
- OpenAPI documentation can be used to inspect available paths and response structures.

Quality Assurance

- The latest recorded full test run completed with 147 passed tests and 1 warning.
- Automated tests cover API, ETL and KPI functionality.
- After changing analytical logic, rerun relevant tests and then the full test suite.

Common Troubleshooting

- If the dashboard does not load, confirm the virtual environment is active and Streamlit starts without errors.
- If data is missing, verify the active database path and expected output files.
- If a PDF or CSV is missing, check the docs/output folders and rerun the relevant generation step.
- When using PowerShell, type only the command and do not copy the PowerShell prompt.

Quick Reference

- Dashboard: Home → Profile → Screener → Peers → Trends → Sectors → Capital → Reports.
- Database: data/nifty100.db
- Generated outputs: output/
- Documentation: docs/
- Testing: pytest
